

# Custom Store API

[Overview](#)

[What is the best use of this API?](#)

[Steps](#)

[SDK Location](#)

[What are the endpoints?](#)

[What fields are available?](#)

## Overview

You must create endpoints to send and receive data with Connex. We send and receive data using JSON. We use basic authentication.

## What is the best use of this API?

If you want to sync orders to and from QuickBooks only, we recommend this API. The Connex for QuickBooks has a rules engine, which makes field mapping customizable. QuickBooks must be on either end of the transaction; if you wanted to sync Amazon and your ERP, use Connex Ecommerce Analytics API.

## Steps

Here are the steps:

1. Create endpoints on your site to send and receive data.
2. Set-up basic authentication on your side.
3. Send us the endpoint URL of your site.
4. We will create an account on Connex for QuickBooks with a selling channel called custom store.

## SDK Location

We created an SDK in C#:

[GitHub - jmawebtech/syncwithconnexapi: Connex for QuickBooks Custom Store API](#)

## What are the endpoints?

Here are the endpoints:

Name	Notes
AuthenticateToWebService	Should return the phase "OK", if basic authentication has passed. You can return an error code, if basic auth failed.
CreateOrders	Used to sync orders from QuickBooks to your software solution.
GetOrders	Used to sync orders from your software solution to QuickBooks.
PurchaseOrders	Used to sync purchase orders from QuickBooks to your solution.

Inventory	Used to sync product updates from QuickBooks to your solution.
-----------	--

### What fields are available?

Here is a partial list:

Name	Description	Notes
OrderNumber	Order number in QuickBooks	
BillingAddress	Billing address in QuickBooks	Includes name and phone number of customer
